

***Endovascular Thrombectomy Outcomes in Large
Core on CT Are Strongly Associated with Perfusion
Core Volume and Time
Implications from Two Large Cohorts for Future Trials***

Introduction

- Endovascular thrombectomy (EVT) efficacy and safety is established in patients with minimal ischemic changes:
 - **ASPECTS ≥ 6**
 - **Small core on perfusion images**
- Patients with significant ischemic changes (large core) were largely excluded from most trials

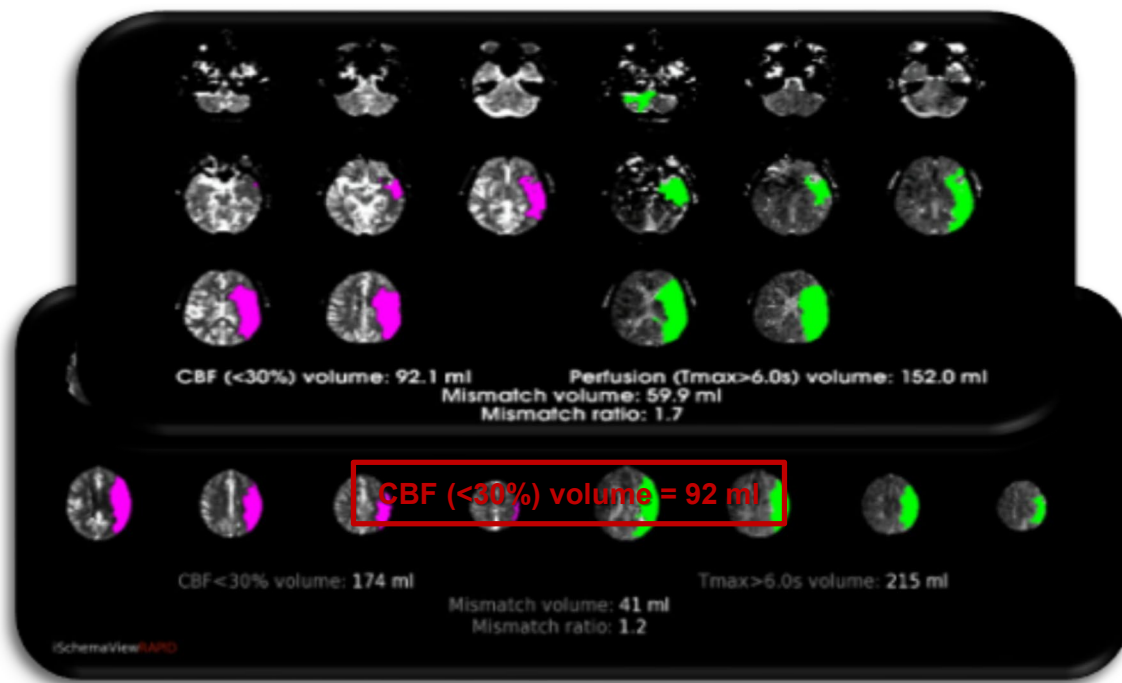

Ischemic Changes on Imaging Modalities

- Large core definition may differ between CT and CTP:
 - CT ASPECTS detects hypodense tissue
 - CTP identifies regions of very low blood flow or volume

ASPECTS=4

CBF (<30%) volume = 174 ml

Objective

- Evaluate the variability of EVT outcomes in patients with large core on CT in relation to:
 - I. CTP core volume
 - II. Time

- Prospective, cohort multicenter study of imaging selection prior to thrombectomy
 - Unified imaging profile (CT, CT angiography, and CTP with mismatch determination using RAPID software) for all patients
 - Blinded core lab evaluated all images
 - Study arms (non-randomized):
 - EndovascularThrombectomy
 - Medical Management
- A post-marketing registry
 - Imaging obtained at the discretion of the investigators
 - Blinded core lab evaluated all images
 - Study arms:
 - EndovascularThrombectomy

Methods

- **Inclusion criteria:**
 - Anterior Circulation LVO (ICA, MCA-M1/M2)
 - Large core on **CT ASPECTS 0-5**
 - NIHSS at presentation ≥ 6
 - LKW to procedure time 0-24 hours
 - Baseline mRS 0-1

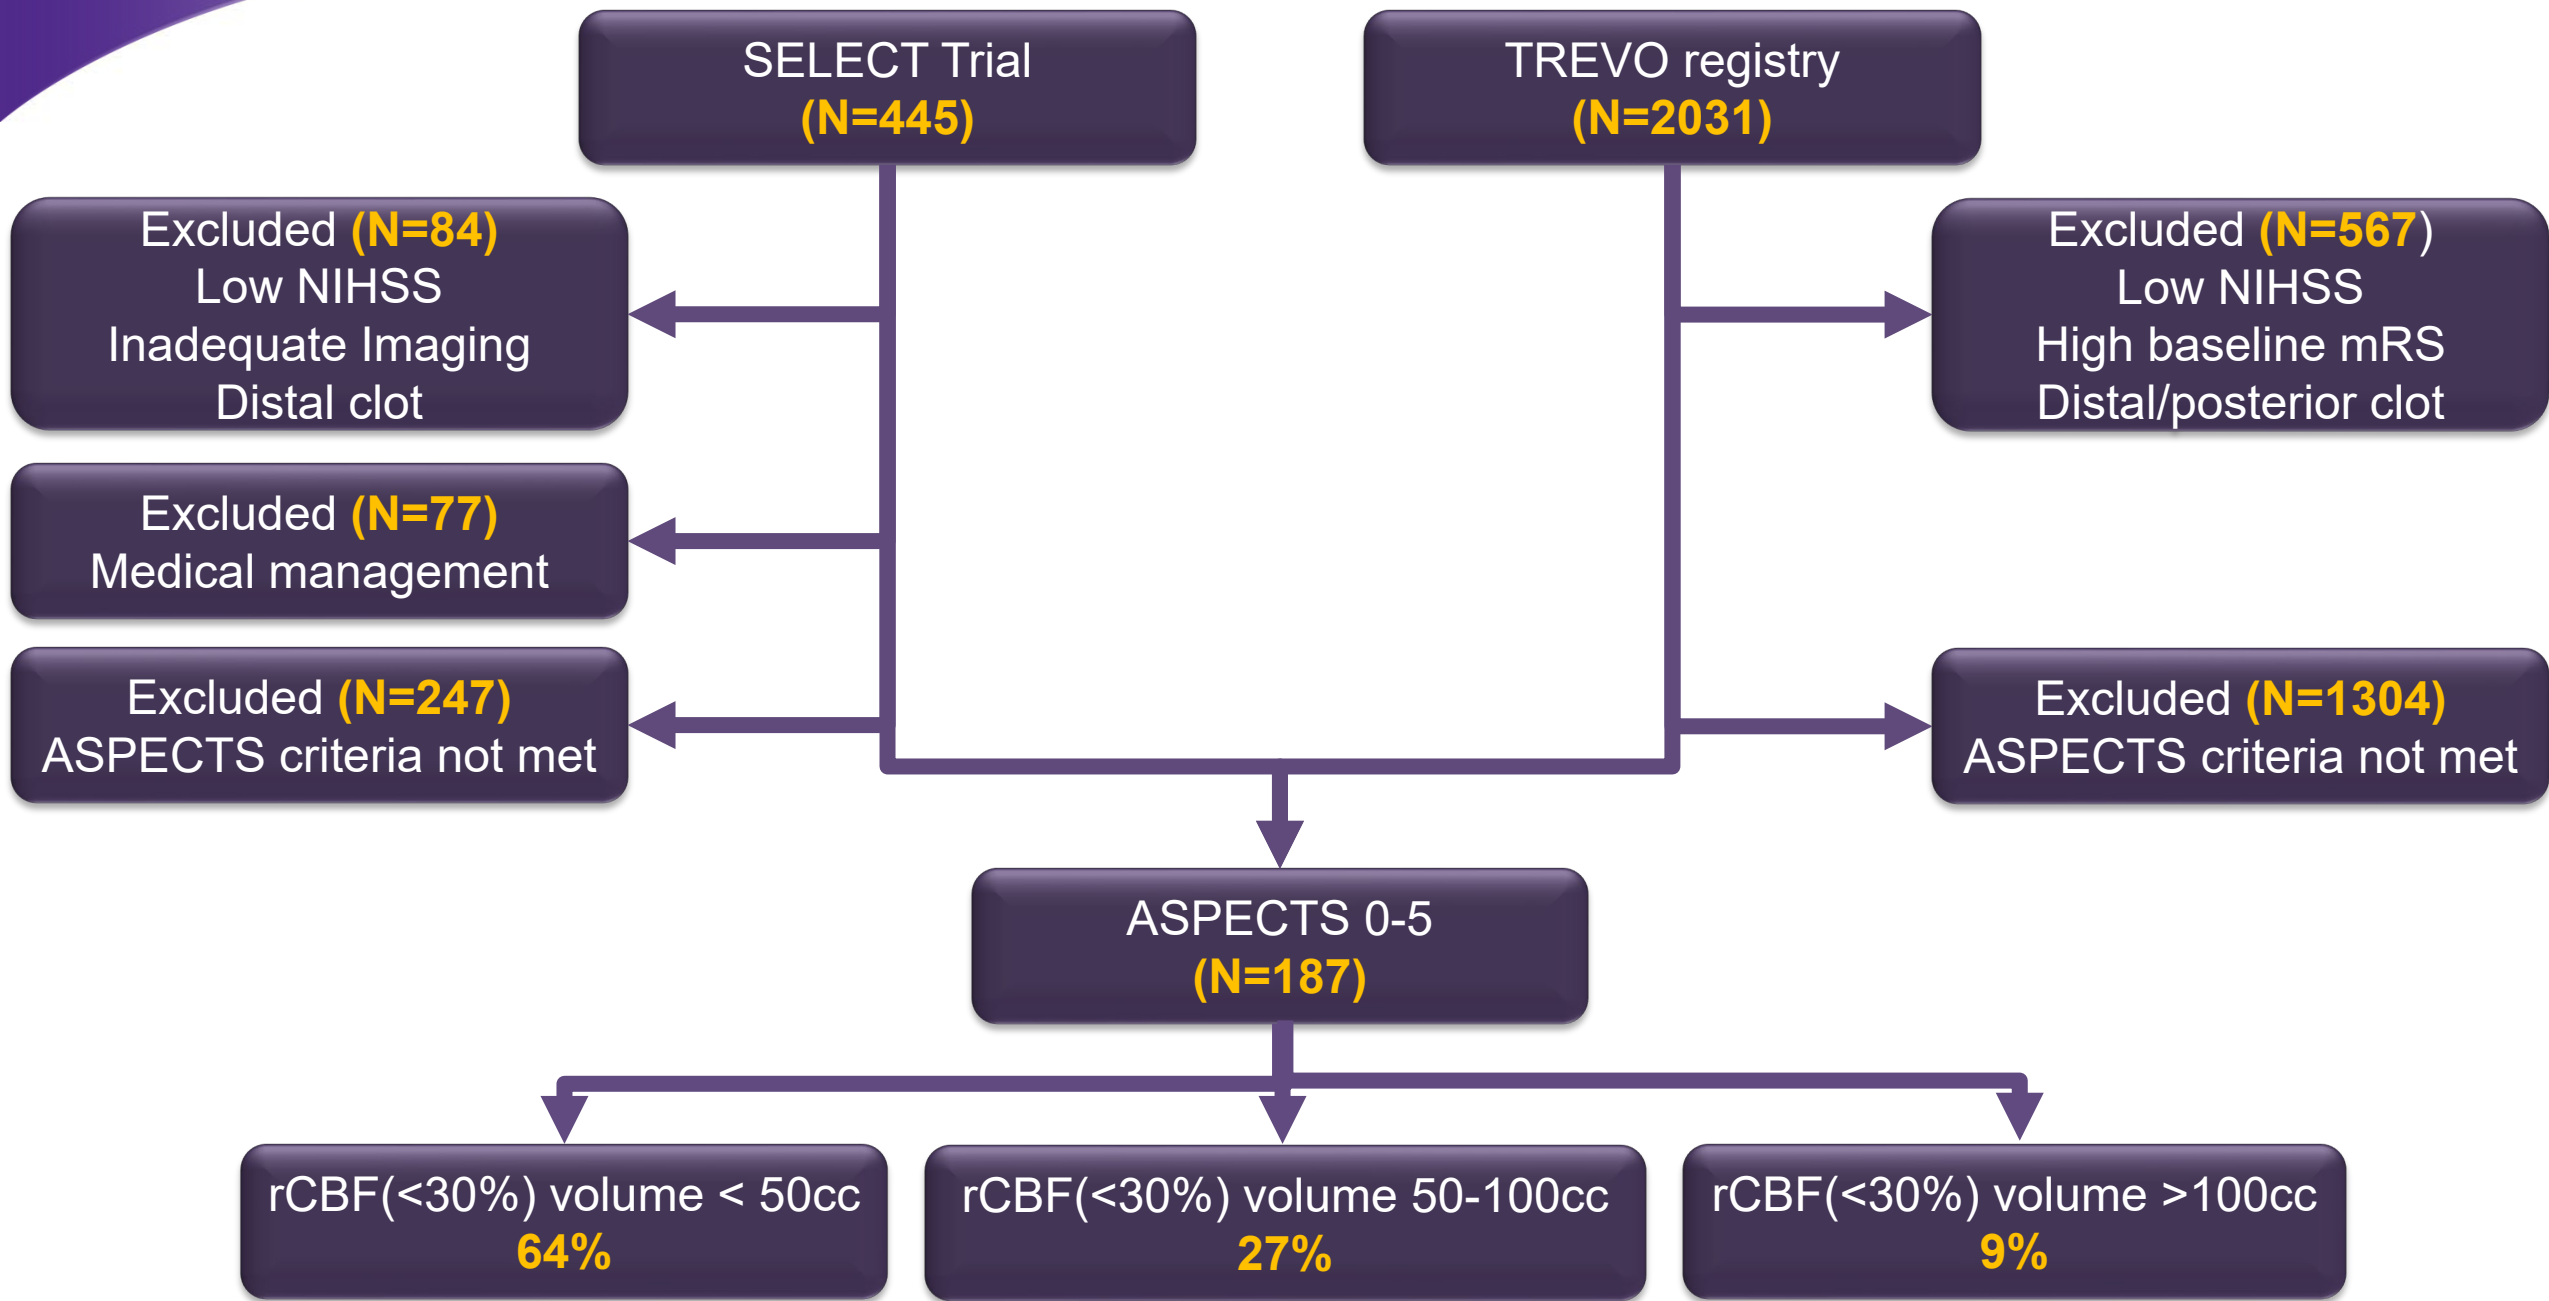

Methods

–Primary Outcome:

- 90 days modified Rankin scores (mRS) of 0-2

–Safety Outcomes:

- Symptomatic intracerebral hemorrhage (sICH)
 - Neurological worsening (decline of ≥ 4 NIHSS points at 24hr)
 - Mortality at 90 days
-
- The analyses were performed on SELECT
 - Validation on the combined cohort of SELECT and TREVO

Baseline Characteristics

	TREVO	SELECT	P-value
Age (years)	64.14(17.66)	63.68 (14.77)	0.89
Hypertension	66%	78%	0.18
Diabetes	31%	38%	0.46
Coronary artery disease	19%	8%	0.24
Baseline NIHSS	17.8(5.4)	18.8 (5.0)	0.36
IV Lytics Administered	47%	70%	0.02
Clot location			
ICA	25%	30%	0.23
M1	58%	65%	
M2	17%	5%	
Transfer Status	53%	51%	0.86
Time from LSN to procedure (min)	6.52(4.60)	5.15(2.70)	0.10
ASPECTS score	4.4 (0.7)	4.4(0.8)	1.0

SELECT Clinical Outcomes

Good outcomes: 48% vs 20% vs 0%, p for trend=0.031
 Symptomatic ICH: 4% vs 0% vs 75%, p for trend=0.002
 Neurological Worsening: 4% vs 22% vs 100%, p for trend<0.001
 Mortality: 4% vs 30% vs 50%, p for trend=0.009

SELECT + TREVO Clinical Outcomes

Good outcomes: 45% vs 29% vs 11%, p for trend=0.018
 Symptomatic ICH: 2% vs 7% vs 33%, p for trend=0.002
 Neurological Worsening: 3% vs 18% vs 56%, p for trend<0.001
 Mortality: 11% vs 29% vs 33%, p for trend=0.019

Probability Of Good Outcomes With Time And Volume (SELECT)

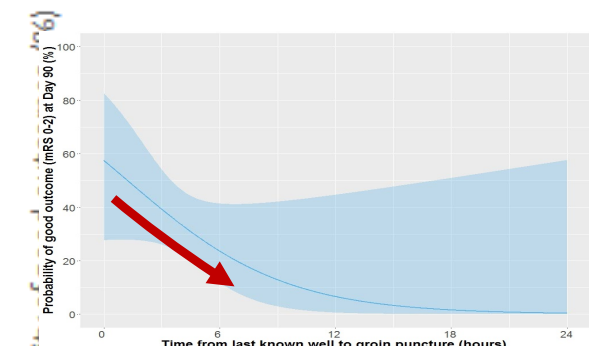

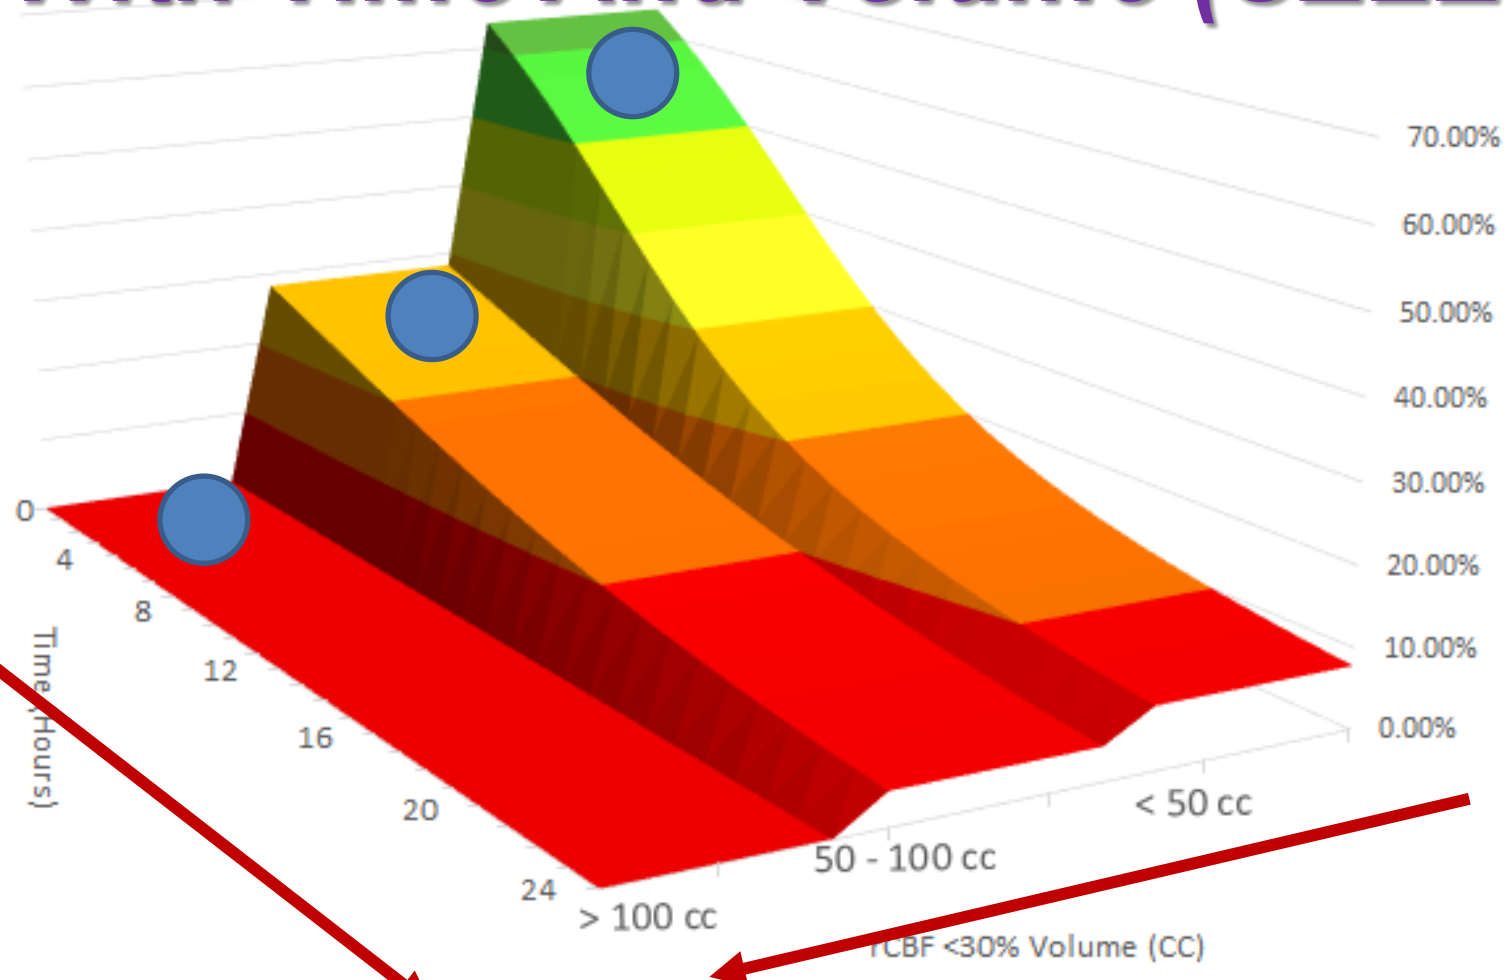

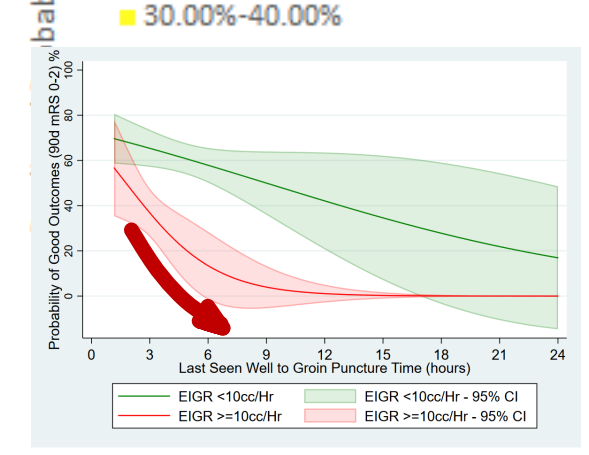

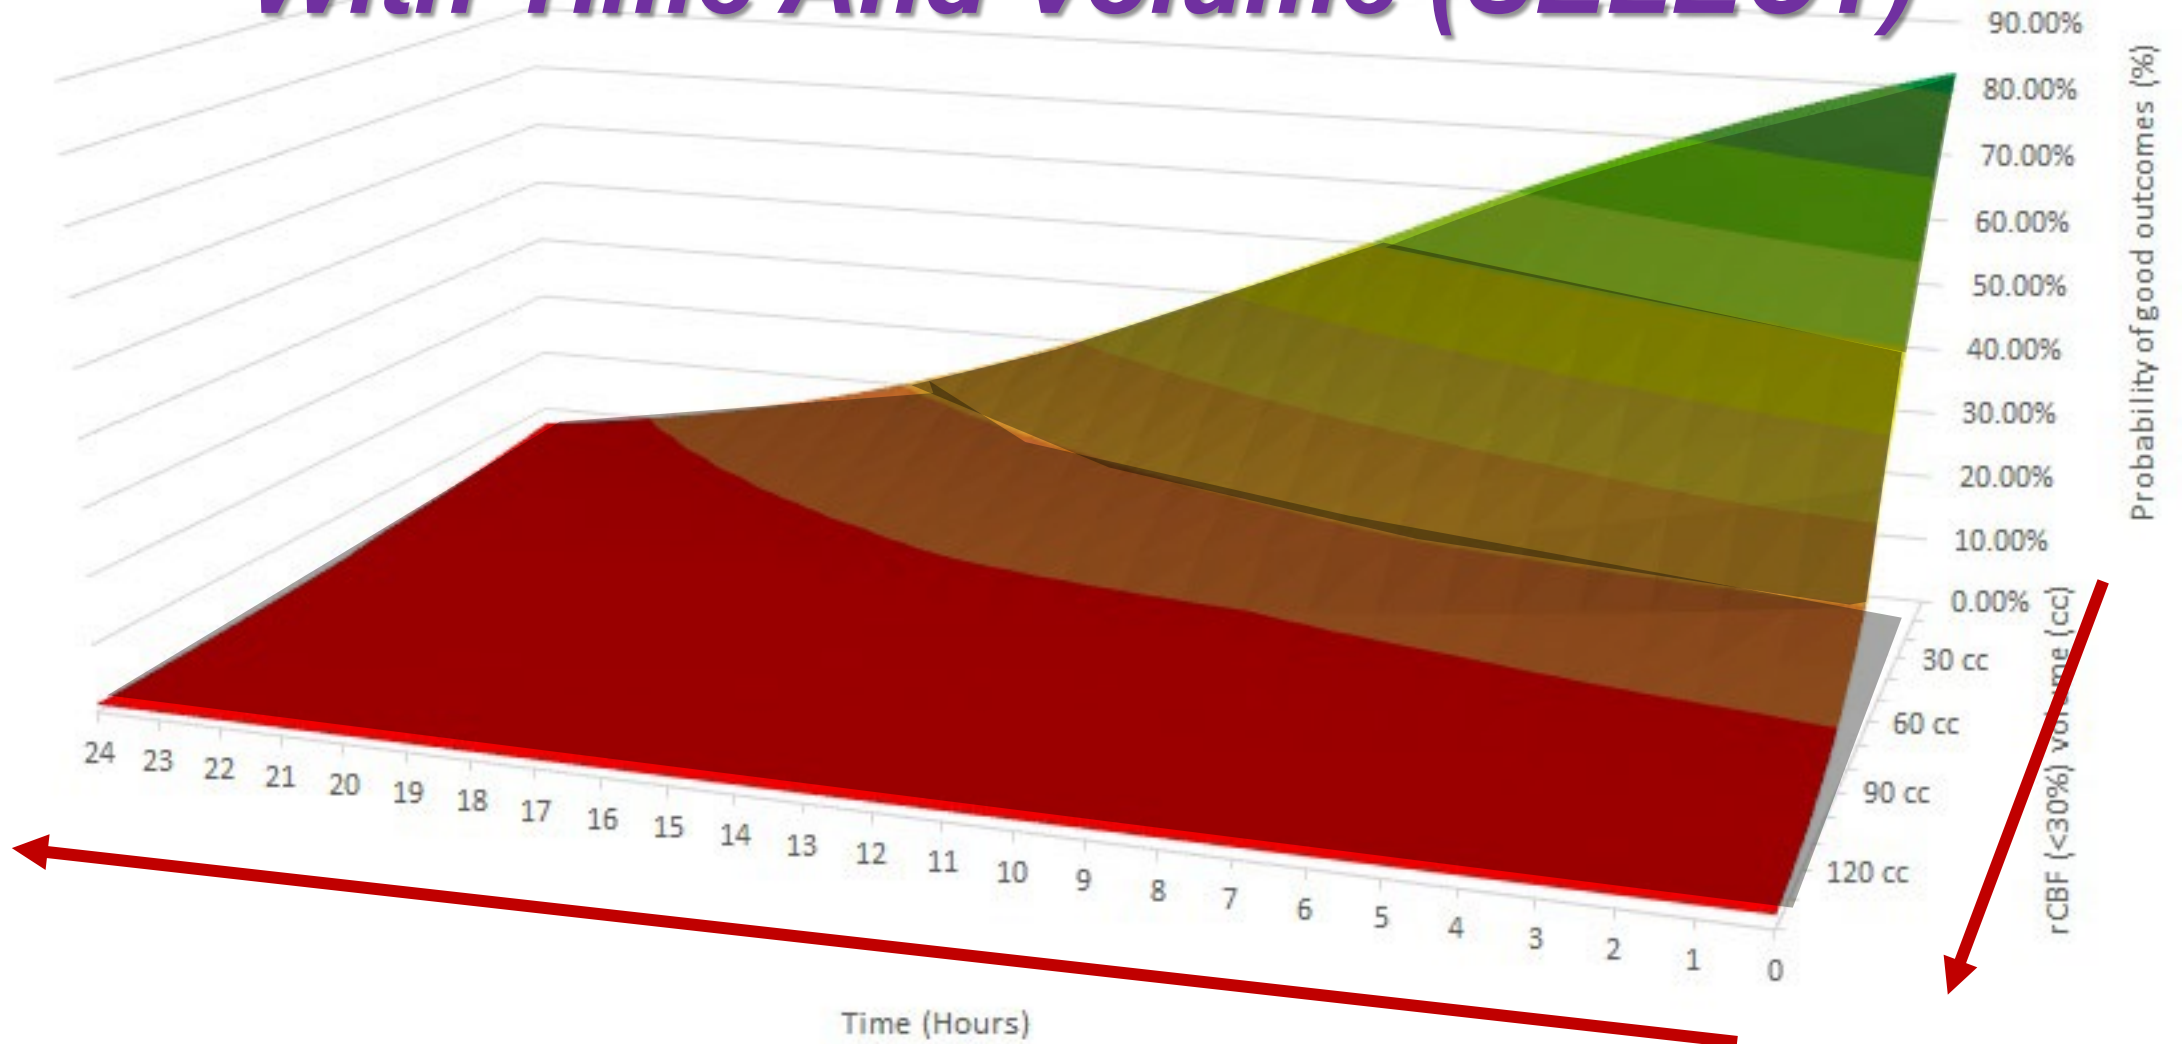

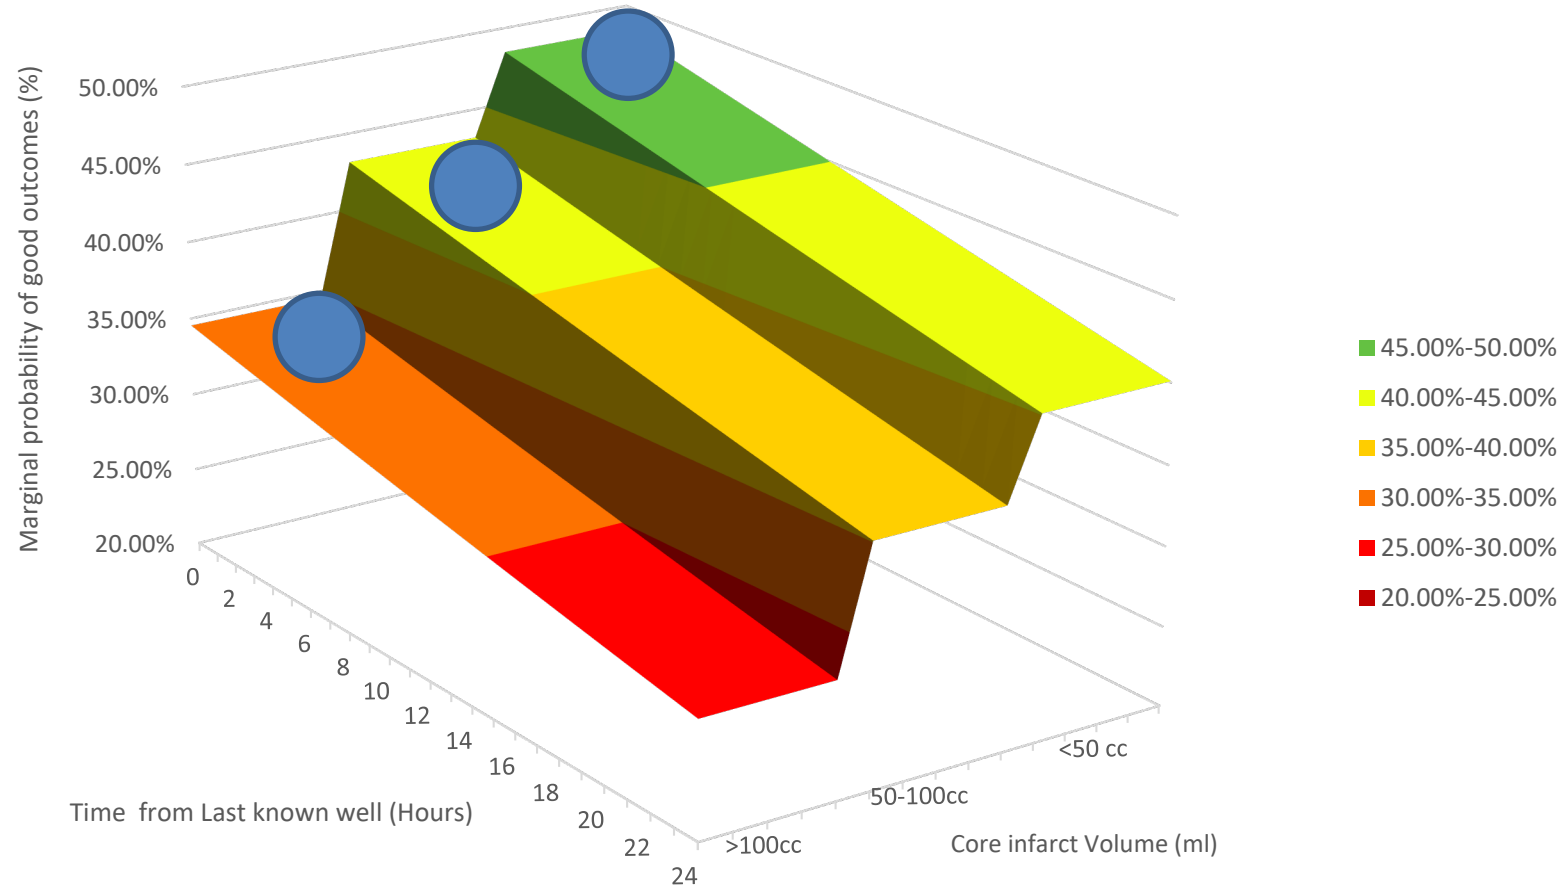

Figure 1 illustrate the probability of good outcome in patients with large core on CT (ASPECTS <6) and /or CTP (rCBF <30%) > 50cc with endovascular thrombectomy in relation to time

Probability Of Good Outcomes With Time And Volume (SELECT)

Probability Of Good Outcomes With Time And Volume (SELECT & TREVO)

Limitations

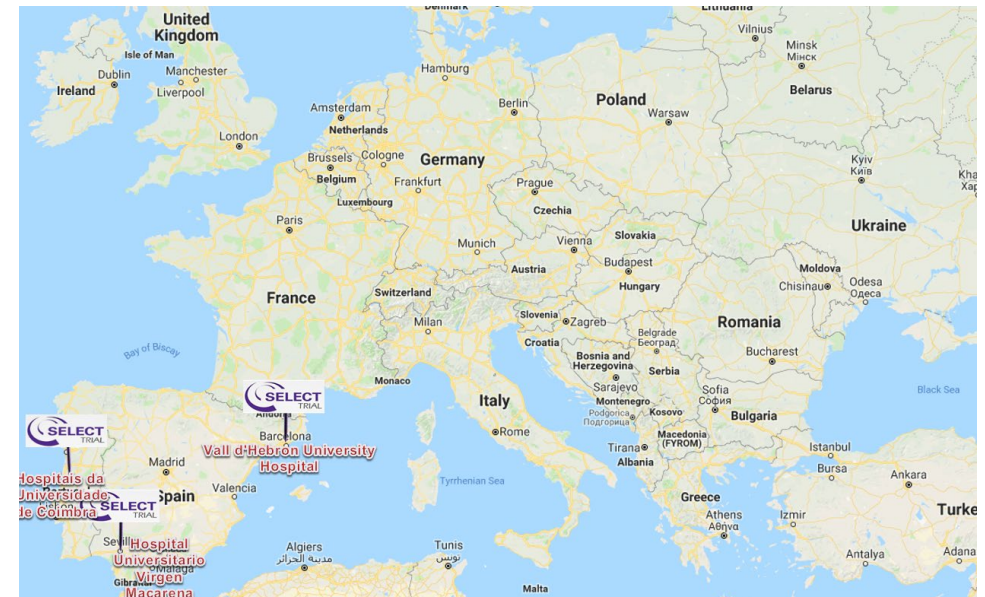

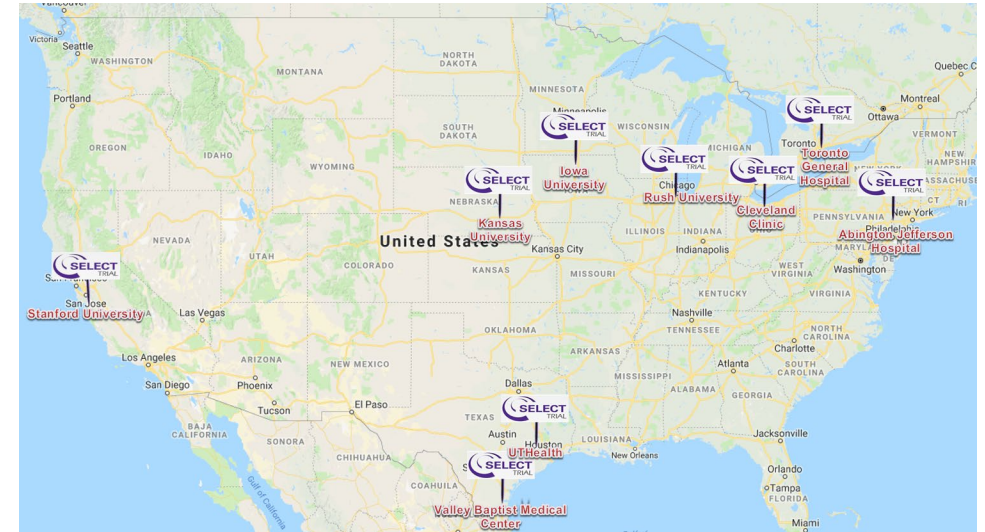

- No medical management controls
- No benefit conclusions can be made
- Unified imaging profile in SELECT
- Imaging selection by site investigators' discretion in TREVO

Conclusion

- In patients with large core on CT, as the volumes increased and time to reperfusion progressed:
 - I. The rates of functional independence declined
 - II. Mortality and symptomatic hemorrhage rates increased
- Low rates of good outcomes with thrombectomy beyond 100 cc
 - May still be better than medical management thus RCTs are needed
- This data can help inform the design of future large core RCTs

SELECT 2

- Randomized, controlled trial assessing:
 - I. Thrombectomy efficacy and safety in patients with unfavorable profiles on CT and perfusion images
 - II. Correlation between imaging and thrombectomy outcomes
- 20 sites
 - US
 - International
- Large core
 - **ASPECTS 3-5**
 - **rCBF (<30%) volume 50-100cc**
- Enrollment goal: up to 460 patients
