¿Qué es la enfermedad arterial periférica?

La enfermedad arterial periférica o EAP es un estrechamiento de las arterias periféricas o arterias que transportan sangre desde el corazón a otras partes del cuerpo, como los brazos y las piernas. EAP también puede aumentar el riesgo de enfermedad de las arterias coronarias, ataque cardíaco y derrame cerebral.

Six simple steps you can take to treat PAD at home

One of the most effective ways to prevent and treat peripheral artery disease, or PAD, is regular physical activity. Dr. Eduardo Sanchez takes us through a simple walking routine that one can help increase leg strength, making it easier to walk and climb stairs, and ease your PAD symptoms.
