**Purpose:** From the MR CLEAN trial, to evaluate the clinical relevance of the results.

**Trial Design:** Analysis of MR CLEAN results for clinical relevance using
1) number needed to treat to benefit (NNTB),
2) number needed to treat to harm (NNTH),
3) benefit per hundred patients treated (BPH), and
4) harm per hundred patients treated (HPH).

**Primary Endpoint:** degree of disability using joint outcome analysis

**Results and Conclusions:** Based on this analysis, when a large vessel ischemic stroke is present, endovascular therapy results:
1 patient / 7 patients (17/100 patients) will not be disabled, and
1 patient / 3-5 patients (22-29/100 patients) will be less disabled.
