2020 Heart Disease & Stroke Statistical Update Fact Sheet
Older Americans & Cardiovascular Diseases

Cardiovascular Disease (CVD) (ICD-9 390 to 459; ICD-10 I00 to I99)
- Based on 2013 to 2016 data, an estimated 121.5 million American adults (48%) had 1 or more types of CVD.
- For the 60–79-year-old age group between 2013 and 2016, the following had CVD: 77.2% of males; 78.2% of females.
- For the 80+ year-old age group, the following had CVD: 89.3% of males; 91.8% of females.

Coronary Heart Disease (CHD) (ICD-9 410 to 414, 429.2; ICD-10 I20 to I25, includes MI ICD-10 I21 to I22)
- For the 60–79-year-old age group between 2013 and 2016, the following had CHD: 19.7% of males; 12.6% of females. 11.5% of males and 4.2% of females in this age group have had an MI.
- For the 80+ year-old age group between 2013 and 2016, the following had CHD: 31.0% of males; 25.4% of females. 17.3% of males in this age group have had an MI; 12.7% of females.
- Based on data from 2005 to 2014, the average age of first heart attack was 65.6 years for males and 72.0 years for females.
- Among Medicare beneficiaries between 2002 and 2011, the incidence of MI hospitalizations declined from 1,485 to 1,122 per 100,000 person-years.

Stroke (ICD-9 430 to 438; ICD-10 I60 to I69)
- According to a study from 2011, stroke patients >85 years of age made up 17% of all stroke patients.
- For the 60–79-year-old age group between 2013 and 2016, the following had had a stroke: 6.5% of males; 5.4% of females.
- For the 80+ year-old age group, the following had had a stroke: 11.5% of males; 13.4% of females.
- Very elderly patients have a higher risk-adjusted mortality, have greater disability, have longer hospitalizations, receive less evidenced-based care, and are less likely to be discharged to their original place of residence.
- Based on a 2012 study, between 2010 and 2050, the number of incident strokes is expected to more than double, with the majority of the increase among the elderly (≥75 years of age) and minority groups.
- According to analyses from the US National Inpatient Sample, over the past decade, in-hospital mortality rates after stroke have declined for every age and sex group except males >84 years of age.

High Blood Pressure (HBP) (ICD-9 401 to 404; ICD-10 I10 to I15)
- For the 65–74-year-old age group between 2013 and 2016, the following had HBP: 70.8% of males; 77.8% of females.
- For the 75+ year-old age group between 2013 and 2016, the following had HBP: 80.0% of males; 85.6% of females.

Unless otherwise noted, all statistics in this Fact Sheet pertain to the United States.

High Blood Pressure (HBP) (ICD-9 401 to 404; ICD-10 I10 to I15) (continued)

- According to 2013 to 2016 data, awareness, treatment, and control of hypertension were higher at older ages. Hypertension control was higher in US adults 40 to 59 years of age with hypertension (24.4%) and those ≥60 years of age (30.0%) than in their counterparts 20 to 39 years of age (10.2%).

Heart Failure (HF) (ICD-9 428, ICD-10 I50)

- According to data from 2013 to 2016, for the 60–79-year old age group, the following had heart failure: 6.9% of males; 4.8% of females.
- According to data from 2013 to 2016, for the 80-year and older age group, the following had heart failure: 12.8% of males; 12.0% of females.
- In a study published in 2013, data from the NHLBI-sponsored Chicago Heart Association Detection Project in Industry, Atherosclerosis Risk in Communities Study, and Cardiovascular Health Study indicated that:
  - HF incidence approached 21 per 1,000 population after 65 years of age.
  - Overall, at age 45 years through 95 years, lifetime risks for HF were high (20%-45%).

Atrial Fibrillation (AF) and Atrial Flutter

- Between 1999 and 2013, among Medicare fee-for-service beneficiaries, rates of hospitalizations for AF increased about 1% a year.
- Among Medicare patients aged ≥65 years, diagnosed from 1993 to 2007, the prevalence of AF increased ≈5% per year, from ≈41.1 per 1000 beneficiaries to 85.5 per 1000 beneficiaries.
- Over five years after AF diagnosis, strokes occur in about 5.0% of individuals 67–69 years of age, 5.7% of individuals 70–74 years of age, 6.9% of individuals 75–79 years of age, 8.1% in those 80–84 years of age, 8.9% in those 80–84 years of age, and 6.9% in individuals age 90 and older.
- Based on hospital discharge data from the 2016 Healthcare Cost and Utilization Project, the rate of AF and atrial flutter as the principal diagnosis in those 65 to 84 years old was 577.5 per 100,000 discharges. The rate in individuals aged ≥85 years was 1158.6 per 100,000 discharges.

Medical Procedures

- In 2014, about 50% of the percutaneous coronary intervention (PCI) procedures were performed on people ≥65 years of age.
- In 2018, 60.3% of heart transplant recipients were age 50 and older.

Costs

- Total direct and indirect annual costs for CVD and stroke in 2014 to 2015 were $150.2 billion for patients 65 years of age and older; about 42.8% of total CVD and stroke costs.
